

GEUTEBRÜCK

Site Security

Your location – completely secured

Do you want to secure an object against a wide range of risks, such as unauthorized access, theft and vandalism?

Using our video analysis, you can detect intruders quickly and reliably and fully document all activity at entrances and driveways. Interfaces with other security subsystems, for instance the access control system, provide additional security. With graphical site maps, you always have a complete overview of all events and can process alarms centrally, whether in the object or via remote access.

Select the right components from our range of solutions to perfectly meet your needs. And you can later modify the system quickly and easily when your needs change.

Site Security

Reliable detection

Intelligent video analysis detects all intruders reliably and automatically. You can go about your work in calm.

Fast alarms

Alarm image display alongside live streams of the current situation provides relevant information quickly. With the support of the alarm plans, you can concentrate on taking the proper actions.

Individual integration

Graphical maps provide a comprehensive overview, including information from third-party systems. You can define yourself what is displayed and how it is shown.

Perimeter protection

The first step of an intruder into your object is taken across your property boundaries. Secure them with a combination of suitable outdoor cameras and the certified video analysis system G-Tect/VMX. Use of thermal imaging cameras like the G-Cam/PTHC is ideal. They provide reliable detection even without additional lighting, over greater distances. Additional movable overview cameras that monitor the alarm zone immediately provide you with valuable information, allowing you to assess the situation and take further measures. Using interfaces you can also easily integrate third-party systems such as fence detection systems for two-detector dependency.

The advantages at a glance

Security, self-defined

Monitor sensitive areas precisely with the help of intelligent alarm zones that you define yourself.

Security made simple

The system settings are so easy to define that you can configure and adapt them yourself.

Enhanced security

By connecting third-party systems, such as perimeter detection, you can increase your security level.

Alarm and information management

If the security system reports an alarm, according to the alarm procedures you defined, you are informed immediately. For a quick assessment of situation, alarm information, recordings and live images are displayed together. Whether in the control center on site or over a network, whether on a permanent workstation or your mobile device – you maintain an overview and can act accordingly! The security management software G-SIM supports your security personnel with graphic maps for a clear picture of the situation. Individually definable action plans, which are processed step-by-step, help keep the situation manageable. Connected third-party systems are integrated into the display as well.

The advantages at a glance

An overview of all areas

At all times, you have a complete picture of the situation and can immediately initiate targeted measures when an incident occurs.

Remain calm when an alarm occurs

The alarm is presented in a clear and understandable manner and the processing plans provide you with effective support, allowing you to remain calm and concentrated.

Analysis for prevention

You also work preventively, comprehensively analyzing causes with useful tools.

Access control with number plate recognition

Reliable entrance and exit control with automatic number plate recognition protects you from unauthorized vehicles on your property. Because our special camera, analysis software and lighting work together in perfect harmony, you are able to reliably detect vehicle number plates.

With the Vehicle Access Manager, you can define in advance when a vehicle is expected or allowed to leave. Barriers and gates are then controlled automatically. An unauthorized attempt to enter or exit instantly generates a message for the desired recipient, for instance at the gate.

The advantages at a glance

Complete control

Vehicle movements are recorded and documented using number plates and vehicle data.

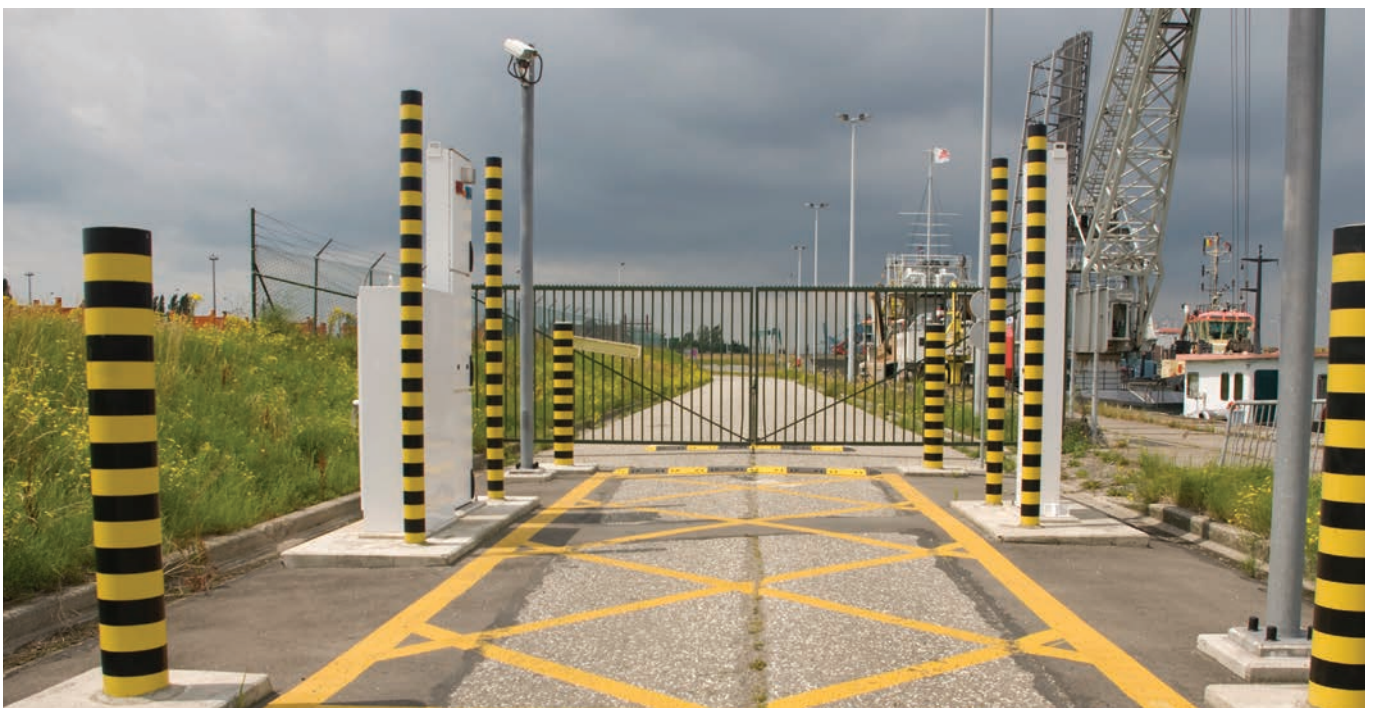

Efficient access control

Central processing of access permissions makes an efficient process possible.

Verifiable processes

All entrances and exits and length of stays are clearly presented in clear reports.

Documented security at the entrance

Just like the access road, the entrance must be monitored and documented so that no unwanted visitors gain access to your object. In areas where security is critical, a personal inspection can be necessary, using metal detectors and X-ray scanners to detect objects.

The fact that this process has been carried out carefully and conscientiously while still respecting all personal rights can be recorded using video documentation and logged as evidence for use in legal proceedings.

The advantages at a glance

Easy integration

Easily connect the access control, X-ray scanner and the video management. All images are thus ordered immediately.

Clear playback

All camera images are displayed synchronously. This allows you to maintain an overview when searching.

Fast search operations

With the help of additional recorded data, you can find the relevant images immediately, using for example the time and date or the visitor badge number.

Image documentation and search

Many security incidents are unfortunately discovered after the fact. For clarification in terms of legal liability and to prevent similar incidents in the future, complete documentation of all operations in the image is extremely helpful. Cause analysis and preservation of evidence are performed efficiently and conveniently right on the Video Management System or from your workstation. When performing a search operation, in addition to the time and date you can use other information, even from third-party systems, that was saved with the images. For example, you can search for a recorded number plate or the name or ID number of a person who was recorded using the access control system. Searching for movement in certain areas of the image can also be performed quickly and easily and can be extremely helpful.

The advantages at a glance

Fast search operations

Find the images you are looking for with just a few clicks of the mouse. You can find out what happened when, find movement in defined areas of the image or find pictures of the vehicle with the desired number plate.

Easy preservation of evidence

Once found, you can export the images in the desired format – as photos in a PDF with additional comments or a whole image file. They can also be encrypted and password-protected for a complete, secure chain of evidence.

Efficient prevention

Analyze the processes before and during an incident to define preventive measures. The fluid, synchronous image playback from multiple cameras also, with fast-forward or rewind functionality, is extremely helpful in this situation.

Availability, data protection and audit

A security system must be absolutely reliable. Redundancy in hardware and fail-over solutions in software offer comprehensive reliability. When errors do occur, reporting procedures provide information immediately. The integrated scene validation for sabotage protection ensures that all cameras remain in their correct positions, recording the intended areas. Data protection is ensured through a comprehensive user rights management system, including two-person password functionality. Comprehensive options for privacy zones also support personal data protection. The integrated audit function documents every operator action, allowing you to have a complete overview of the work of the security personnel.

The advantages at a glance

Availability according to needs

Use our offer of redundancy in hardware and fail-over solutions on the software side to create your individual desired level of availability. Check the status of the system easily using the web tool. Automatically keep informed by the service technician regarding defects.

User rights according to needs

Easily and centrally define the access rights for each user, each user group or each workstation – individually, flexibly and efficiently. You can even set up priorities for the control of moveable cameras depending on the user or status.

Monitoring according to needs

Monitor and review the work of all users using the integrated audit function. Sift and analyze all system and operational processes using the tamper-proof, seamless, system-internal logging.

We are Geutebrück

- 50 years of experience in video management ...
- ... with own development on site.
- Since the first day: Made in Germany ...
- ... and represented worldwide with sales and service partners.
